1. Introduction

The Pine Lake Outlet Drain #1689 is a proposed drainage outlet system for Pine Lake. There is no known existing drainage outlet system for Pine Lake. Pine Lake is currently acting as a retention system and holding all of the stormwater runoff entering the lake. The lake levels fluctuate depending on the amount of rainwater being received and the amount the water in the lake that can leave mainly by evaporation and infiltration. The purpose of this preliminary drainage study is to evaluate the runoff entering the lake and determine outlet alternatives for Pine Lake.

2. Site Location

The overall drainage area for Pine Lake is located in parts of Sections 28, 29, 32, and 33 of Fenton Township. A location map of the overall drainage area of the lake and the project location may be found in Appendix 'A' of this report. The overall drainage area is bounded roughly by Linden Road to the west, Harp drive to the north, Silver Lake to the east, and Owen road to the south. The size of the overall drainage area for Pine Lake is approximately 712+/- acres.

3. Existing Drainage Outlet

As previously mentioned, currently there is no known existing drainage outlet system for Pine Lake. The stormwater runoff entering the lake is being retained within the lake area. Evaporation is the main way for the lake levels to be lowered at this time without an outlet to another surface water drainage system.

The lake elevation for Pine Lake is approximately 10 feet higher than the lake elevation for Silver Lake to the east and Byram Lake to the west. Please see Appendix 'B' for the Existing Drainage Area map for Pine Lake. An underground connection such as a gravel or sand vain of some sort between Pine Lake and Silver Lake or Byram Lake does not appear to exist because the lake elevation for Pine Lake is consistently and significantly higher than the lake elevation for Silver Lake and Byram Lake. If a connection of this type existed then the lake elevations for a three lakes would be near the same elevations.

Byram Lake to the northwest is about 2000 feet away from Pine Lake and the highest elevation between the two (2) lakes from the Harp Drive/Whitaker Road area to Byram Lake is approximately 936 which is approximately 56 feet above the elevation of Pine Lake. Silver Lake to the southeast is

about 800 feet away from Pine Lake and the highest elevation between the two lakes from the Eleanor Street/Island View Drive area to Silver Lake is approximately 906 which is approximately 26 feet above the elevation of Pine Lake. Based on these elevation differences and horizontal distance, it appears that if some type of existing drainage outlet ever existed for Pine Lake then this connection would be between Pine Lake and Silver Lake.

A field investigation was performed to determine if a direct connection such as a storm sewer system or culvert existed between Pine Lake and Silver Lake could be found. The area along Eleanor Street, Island View Drive thru Chateau Du-Lac Condominium and along Curtwood Drive was investigated for such a connection. The road elevations vary along Eleanor Street and Island View drive to the northeast thru Chateau Du-Lac condominium and thru Curtwood drive. The lowest elevation along Island View drive is approximately 884; however, the elevation between Pine Lake and Island View near this low point is approximately 900 which is about 20 feet above the lake level for Pine Lake. The lowest elevation along the road through Chateau Du-Lac is approximately 906 and this elevation is approximately 26 feet above the lake level for Pine Lake. The lowest elevation along Curtwood drive is approximately 884 at the very northeast location of a large existing wetland/swamp area which is about 4000 feet to the northeast from Pine Lake. No direct connection was found to exist between Pine Lake and Silver Lake along these areas. Elevations throughout the Pine Lake Shoreline including along the large existing wetland/swamp area to the northeast of Pine Lake were obtained. These elevations range in value from 881.3 to 882.2 and are about 1.3 to 2.2 feet above the level of Pine Lake. The elevations obtained within the wetland confirm that the runoff from the wetland/swamp area drains to the southwest towards and into Pine Lake. It was observed through a field investigation that the flow thru the wetland/swamp area is towards Pine Lake. Also, based on the elevations obtained, if Pine Lake were to flow towards Silver Lake through the wetlands/swamp area then the elevation of Pine Lake would need to rise to an elevation of about 882. This elevation of 882 would flood several structures around the lake. At this time, only one structure located along Scenic View Drive is known to have flooded at the reported high lake level of approximately 881.5.

4. Basis of Evaluation and Design

A. Hydrology – (Stormwater Runoff/Detention)

DRAINAGE AREAS

The approximate overall drainage area used in this study was determined from Genesee County Drain Commissioner's Office two foot (2') contour maps and reviews of available plans for

existing developments within the drainage area. Field observations were also completed by Gould Engineering, Inc to verify the overall drainage area. A map of the overall drainage area may be found in Appendix 'B'. Gould Engineering, Inc. determined the overall drainage area to Pine Lake to be approximately 712 acres. Therefore, based on Genesee County Drain Commissioner's Office-SWM standards, the SCS Method was used to calculate peak runoff flows and detention routing and outlet rates for a one percent (1%) chance (100 year) storm event.

SCS METHOD

The SCS Method was used to determine the amount of storm water runoff from the drainage areas identified in this report. This hydrology method uses the characteristics of the drainage area to generate hydrographs and flows. These characteristics include hydrologic soil types (A, B, C, or D), the land use/coverage type and the time of concentration of the drainage area.

The hydrologic soils group is used to classify the existing soils of the sub-areas into different types of infiltration rates. The infiltration rates of soils can vary from having high rates of infiltration similar to gravel and sandy soils to having very low rates of infiltration similar to dense clays. The hydrologic soil groups A, B, C, and D are further described as follows.

Soil Group A - These soils have high infiltration rates and low runoff potential even when thoroughly wetted. Examples of these types of soils are sands and gravels.

Soil Group B - These soils have moderate infiltration rates when thoroughly wetted. These soils have moderately fine to moderately coarse textures and a moderate rate of water transmission.

Soil Group C - These soils have low infiltration rates when thoroughly wetted. These soils have moderately fine to fine texture and a low rate of water transmission.

Soil Group D - These soils have very low infiltration rates when thoroughly wetted and high runoff potential. Examples of these types of soils are clay soils which have high swelling potential and very low rates of water transmissions.

The land use/cover type of these soils further determine the amount of runoff from the drainage areas. The land use/cover type within the overall drainage area consists of various types of impervious surfaces such as pavements and buildings, and pervious areas such as lawns, open areas, crop land, meadows, and woods.

The overall drainage area for this study consists primarily of Soil Group B with some Soil Group C and D soils scattered throughout. The primary land uses are residential developments, the open water of Pine Lake, and wooded areas and wetland/swamps. The land uses are identified on a topographic and aerial photography map included in Appendix 'C'.

TIME OF CONCENTRATION

The time of concentration for drainage paths to Pine Lake was calculated for the inflow hydrograph to the lake for the overall drainage area. The GCDC-SWM standard of twenty (20) minutes was used as a minimum initial time of concentration for the drainage routes to the lake. This minimum initial time plus the travel time calculated to the drainage outlet for the lake determines the time of concentration.

DETENTION

The available detention within Pine Lake stores the stormwater runoff while the proposed outlets evaluated outlet a flow at a reduced rate. This reduced outflow rate is typically less than the flow that would be experienced entering the lake. The detention within Pine Lake was designed based on inflow for the 100-year storm event which is a standard of the GCDC-SWM. The outlet rate from Pine Lake and the detention within it are further discussed in each alternative.

B. Hydraulics – (storm drainage outlet)

FLOW MASTER

Haestad Method's FlowMaster program was used to evaluate and design the proposed outlet sizes for the improvement alternatives. This program utilizes Manning's Equation to calculate capacities of pipes under partially full flow and full flow conditions for the calculated outlet rates. The FlowMaster program also calculates the velocity of the water as it passes through the proposed pipes. This information is necessary in determining whether the velocities within the pipe are within the allowable range of approximately two (2) fps to ten (10) fps.

EAGLE POINT WATERSHED MODELING MODULE

The Eagle Point watershed modeling module is a computer program which is used to evaluate the detention within Pine Lake and design various lake outlet alternatives. The basis for the program is the SCS method for determining flows and Manning's equation for pipe flow and Bernoulli's equation for the hydraulic grade line. Various input data such as design weir sizes, pipe size, pipe types, lengths, and outlet elevations are input into the program. The program performs multiple calculations for routing the inflow through the lake and the outlet alternatives. The GCDC-SWM standard for enclosed drainage pipe design is to design for full pipe flow with no surcharging. The evaluation of the various design outlet alternatives are further discussed in later sections of this report.

5. Proposed Improvement Alternatives

Three (3) alternatives were evaluated in order to provide a drainage outlet for Pine Lake. Alternative 1 discusses an outlet route along Eleanor Street south to Owen Road and then east along Owen Road to Silver Lake. Alternative 2 discusses an outlet route near the intersection of Eleanor Street and Island View Drive and runs to Silver Lake from Island View Drive. Alternative 3 discusses an outlet route near end of Eleanor Street which runs to the southeast across Island View Drive to Silver Lake along an existing storm sewer outlet to Silver Lake for Island View Drive.

The possibility of a drainage outlet to the east thru the large wetland area located on the east end of Pine Lake and across the road within Château Du-Lac to Silver Lake was reviewed. A route through these wetlands would be approximately 2700 feet long from the Pine Lake to the road. This length would require an open drain along the route to be flat and have a width of as much as 60 feet to control the elevation of Pine Lake. The Michigan Department of Natural Resources and Environment (MDNRE) would require a permit for this route due to the existing wetlands. As a part of the permit process for disturbance to wetlands, the MDNRE requires a justification for the selection of this route and an evaluation of reasonable and prudent alternatives to minimize disturbance to wetlands. Due to the large drain width and the disturbance expected to the existing wetlands along this route, it was determined that this route would not be feasible or permittable by the MDNRE when compared to the Alternative routes presented in this report.

Field survey elevations have determined the elevation of Pine Lake to be approximately 880.0 in the month of July, 2010. The residents of the properties where the elevations were taken have indicated that this elevation of the lake is an acceptable elevation to be maintained. The property and building adjacent to Pine Lake with the lowest ground elevation has an elevation of approximately 881.2 near the building. The outlet structure to control the lake level for all three Alternatives is based on these elevations.

All three (3) outlet alternatives will also require new easements along parts of the proposed routes which are located outside of the existing Genesee County Road Commission road right-of-way. Some parts of the routes may require easements adjacent to the road right-of-way for maintenance due to the depth of the outlet pipe. All of the easements will be required to be dedicated to the Genesee County Drain Commissioner's office for maintenance of the proposed outlet. The following discusses each alternative in more detail:

- ALTERNATIVE 1:

The pipe outlet for Alternative 1 is a proposed 30" diameter storm sewer pipe which runs south from Pine Lake to Island View Drive between the buildings located at 5006 Island View Drive and 4520 Eleanor Street which are located at the northwest portion of the intersection of Island View Drive and Eleanor Street. From the intersection it is proposed to run this outlet pipe down the east side of Eleanor Street to the north side of Owen Road. The proposed outlet pipe turns east and runs on the north side of Owen Road and outlets to Silver Lake. The route for the outlet pipe of Alternative 1 may be found on the drawing located in Appendix 'E'. There is an existing 8" sanitary sewer and sewage pump station along with two sewer forcemain located on the north side of Owen Road between the paved road and the road right-of-way. Because of these existing utilities the proposed outlet pipe is required to be located in an easement north of the road right-of-way to avoid conflicts with the utilities.

The elevation of the intersection of Island View Drive and Eleanor Street is approximately 906 where as the proposed lake level is at approximately 880.0. There is a 26 foot difference between these elevations. Because of this large elevation difference it is proposed to jack the pipe from the lake to the intersection to avoid the deep cuts required to construct the outlet pipe in between the buildings located at 5006 Island View Drive and 4520 Eleanor Street. A deep cut excavation will occur at the intersection of Island View and along Eleanor Street for a distance towards Owen Road. Due to the deep excavation it is expected that half of Eleanor Street and the Intersection of Eleanor and Island View Drive will have to be reconstructed.

An outlet structure with a weir is proposed at the end of the 30" pipe at Pine Lake to control the lake elevation. This outlet structure is proposed to consist of a concrete box with a minimum 10 foot weir to control the high levels of Pine Lake. A drawing showing a preliminary sketch of this outlet structure may be found in Appendix 'E'. The elevation of the top of the weir is proposed at 880.0 with an approximate high lake level of approximately 880.9 for the one percent (1%) chance (100 year) storm event. The weir is not intended to control the levels of the lake below elevation 880.0 because there is not a constant source of inflow to the lake such as a creek or a river with a constant flow of water. The low levels of the lake will depend on the amount of rain the overall drainage area of the lake receives and the evaporation amounts. During drought conditions it is likely that the lake level will drop below the 880.0 elevation. Because the outlet structure will be located at Pine Lake and will likely involve disturbance to the bottom lands of Pine Lake a permit under Part 301 – Inland Lakes and Streams from the MDNRE will be required for this structure prior to construction of the outlet.

Calculations for the inflow into the lake, the weir and lake reservoir as well as the routing of the inflow through the lake and the 30" pipe outlet may be found in Appendix 'E'.

The Preliminary Opinion of Probable Construction Cost (POPCC) for Alternative 1 is \$467,000.00±. Further information related to this POPCC may be found in Section 7.

- **ALTERNATIVE 2:**

The pipe outlet for Alternative 2 is a proposed 30" diameter storm sewer pipe which runs south from Pine Lake to Eleanor Street between the buildings located at 4500 and 4492 Eleanor Street which are located northeast from the intersection of Island View Drive and Eleanor Street. It is proposed to run this outlet pipe south to Island View Drive. The proposed outlet pipe turns east and runs on the south side of Island View Drive approximately 335 feet and then turns south to outlet to Silver Lake between the buildings located at 4459 and 4469 Island View Drive. The route for the outlet pipe of Alternative 2 may be found on the drawing located in Appendix 'F'. There is an existing storm sewer along with telephone and gas utilities located on the south side of Island View Drive between the paved road and the road right-of-way. Because of these existing utilities the proposed outlet pipe may be located near the road right-of-way line such that easements along the south right-of-way may be needed for maintenance.

The elevation in between Island View Drive and Eleanor Street is approximately 906 where as the proposed lake level is at approximately 880.0. There is a 26 foot difference between these elevations. Because of this large elevation difference it is proposed to jack the pipe from the lake to Island View Drive to avoid the deep cuts required to construct the outlet pipe in between the buildings located at 4500 and 4492 Eleanor Street and west of the building located at 4490 Island View Drive. A deep cut excavation will occur along Island View Drive for approximately 335 feet until the route turns south to outlet to Silver Lake between the buildings located at 4459 and 4469 Island View Drive.

The outlet structure for Alternative 2 will be the same as Alternative 1. The outlet structure with a weir is proposed at the end of the 30" pipe at Pine Lake to control the lake elevation. This outlet structure is proposed to consist of a concrete box with a minimum 10 foot weir to control the high levels of Pine Lake. A drawing showing a preliminary sketch of this outlet structure may be found in Appendix 'E' for Alternative 1. The elevation of the top of the weir is proposed at 880.0 with an approximate high lake level of approximately 880.9 for the one percent (1%) chance (100 year) storm event. The weir is not intended to control the levels of the lake below elevation 880.0 because there is not a constant source of inflow to the lake such as a creek or a river with a constant flow of

water. The low levels of the lake will depend on the amount of rain the overall drainage area of the lake receives and the evaporation amounts. During drought conditions it is likely that the lake level will drop below the 880.0 elevation. Because the outlet structure will be located at Pine Lake and will likely involve disturbance to the bottom lands of Pine Lake, a permit under Part 301 – Inland Lakes and Streams from the MDNRE will be required for this structure prior to construction of the outlet.

Calculations for the inflow into the lake, the weir and lake reservoir as well as the routing of the inflow through the lake and weir outlet may be found in Appendix 'E' for Alternative 1. Calculations for the 30" outlet pipe of Alternative 2 may be found in Appendix 'F'.

The Preliminary Opinion of Probable Construction Cost (POPCC) for Alternative 2 is \$453,000.00±. Further information related to this POPCC may be found in Section 7.

- **ALTERNATIVE 3:**

The pipe outlet for Alternative 3 is also a proposed 30" diameter storm sewer pipe which runs south from Pine Lake to Eleanor Street between the buildings located at 4350 and 4330 Pavilion Drive which are located at the end of Eleanor Street. It is proposed to run this outlet pipe south to Island View Drive and then outlet to Silver Lake between the buildings located at 4341 and 4349 Island View Drive. The route for the outlet pipe of Alternative 3 may be found on the drawing located in Appendix 'G'. There is an existing storm sewer outlet to Silver Lake for Island View drive along this route for the proposed storm outlet for Pine Lake

The elevation in between Island View Drive and Pavilion Drive is approximately 908 where as the proposed lake level is at approximately 880.0. There is a 28 foot difference between these elevations. Because of this large elevation difference it is proposed to jack the pipe from the lake to approximately midway between Pavilion Drive and Island View Drive to avoid the deep cuts required to construct the outlet pipe.

The outlet structure for Alternative 3 will also be the same as Alternative 1. The outlet structure with a weir is proposed at the end of the 30" pipe at Pine Lake to control the lake elevation. This outlet structure is proposed to consist of a concrete box with a minimum 10 foot weir to control the high levels of Pine Lake. A drawing showing a preliminary sketch of this outlet structure may be found in Appendix 'E' for Alternative 1. The elevation of the top of the weir is proposed at 880.0 with an approximate high lake level of approximately 880.9 for the one percent (1%) chance (100 year) storm event. The weir is not intended to control the levels of the lake below elevation 880.0 because there is not a constant source of inflow to the lake such as a creek or a river with a constant flow of

water. The low levels of the lake will depend on the amount of rain the overall drainage area of the lake receives and the evaporation amounts. During drought conditions it is likely that the lake level will drop below the 880.0 elevation. Because the outlet structure will be located at Pine Lake and will likely involve disturbance to the bottom lands of Pine Lake, a permit under Part 301 – Inland Lakes and Streams from the MDNRE will be required for this structure prior to construction of the outlet.

Calculations for the inflow into the lake, the weir and lake reservoir as well as the routing of the inflow through the lake and weir outlet may be found in Appendix 'E' for Alternative 1. Calculations for the 30" outlet pipe for Alternative 3 may be found in Appendix 'G'.

The Preliminary Opinion of Probable Construction Cost (POPCC) for Alternative 3 is \$466,000.00±. Further information related to this POPCC may be found in Section 7.

6. **Recommendations**

The selection of the routes for each of the alternatives evaluated was based on the available access to both Pine Lake and Silver Lake and the shortest routes possible. The distance between existing buildings was a major reason for selecting the routes because many of the existing buildings along Pine Lake and Silver Lake have minimal distances in between them. For Alternative 1, the access route to Pine Lake only involves running between two existing buildings whereas both Alternatives 2 and 3 involves routes between existing buildings for the routes to both Pine Lake and Silver Lake. Alternative 2 and 3 also involve longer borings for the 30" outlet pipe due to the higher ground elevations along the routes and the buildings nearby. The costs for all three alternatives are nearly the same and Alternative 1 has a slightly higher cost than the other two alternatives. Alternative 1, however, involves less construction in between existing buildings and is the recommended alternative.

7. Preliminary Opinion of Probable Construction Costs (POPCC)

- **ALTERNATIVE 1:**

Item Description	Qty	Pay Unit	Unit Price	Amount
1. Precast Concrete Outlet Weir Structure	1±	Each	\$20,000.00±	\$20,000.00±
2. 30" Sewer, C76-III	1090±	L.F.	\$120.00±	\$130,800.00±

SURFACE WATER MANAGEMENT

JEFFREY WRIGHT
COMMISSIONER

G-4608 BEECHER ROAD, FLINT, MI 48532
PHONE (810) 732-1590 FAX (810) 732-1474

Revised November 1, 2006
Effective immediately

STORM SEWER DESIGN PARAMETERS FOR GENESEE COUNTY

IN AN EFFORT TO STANDARDIZE DESIGN PROCEDURES FOR STORM SEWERS AND OPEN CHANNELS IN GENESEE COUNTY, THE GENESEE COUNTY DRAIN COMMISSIONER HAS DEVELOPED THESE STANDARDS. IT IS HOPED THAT THESE STANDARDS WILL FACILITATE PLANNING FROM BOTH THE POSITION OF THE DESIGN AND REVIEWING ENGINEER.

IT IS RECOGNIZED THE DESIGN CONDITIONS VARY AND THERE IS NO SUBSTITUTE FOR THE JUDGEMENT OF AN EXPERIENCED ENGINEER. IN ALL CASES THIS JUDGEMENT SHOULD BE APPLIED.

MANY STREAMS LOCATED IN THIS COUNTY DO NOT HAVE STREAM GAGING DATA AVAILABLE OR THE PERIOD OF RECORD IS NOT OF SUFFICIENT LENGTH TO ALLOW THE DESIGN ENGINEER TO ESTIMATE FLOOD FLOWS BY USING FLOOD-FREQUENCY ANALYSIS AS DEVELOPED BY U.S.G.S. PRIOR TO DESIGN OF ANY STORM DRAIN IMPROVEMENT OR ENCLOSURE THE CONSULTANT SHALL INVESTIGATE ANY GAGING STATION, PARTIAL RECORD GAGING STATION OR CREST STAGE GAGES ON THE DESIGN BASIN FOR AVAILABLE PERTINENT DATA ON FLOOD FLOWS.

WHERE INSUFFICIENT DATA IS PRESENT TO DEVELOP BASIN HYDROLOGY BY THE ABOVE METHOD THE CONSULTANT SHALL DETERMINE FLOWS ALONG THE BASIN BY THE S.C.S. METHOD, THE RATIONAL METHOD, THE BRATER METHOD OR A COMBINATION OF ANY OF THE ABOVE NAMED METHODS. THE BASIN HYDROLOGY SHALL BE APPROVED BY THE GENESEE COUNTY DRAIN COMMISSIONER'S OFFICE PRIOR TO PROCEEDING WITH THE FINAL DESIGN OF A GIVEN PROJECT.

DESIGN PROJECTS SHALL BE DEVELOPED IN ACCORDANCE WITH THE FOLLOWING FLOOD FREQUENCIES.

A. 100 YEAR STORM ON BASIN DEVELOPMENT PROJECT TO YEAR 2000:

1. CULVERTS OR BRIDGES CROSSING STATE HIGHWAYS OR EXPRESSWAYS WHERE THE UPSTREAM DRAINAGE AREA IS IN EXCESS OF 2 SQUARE MILES.
2. DETENTION PONDS.
3. DRAINAGE ENCLOSURES IN EXCESS OF 100 FEET WHERE THE UPSTREAM DRAINAGE AREA IS IN EXCESS OF 2 SQUARE MILES.

- B. 50 YEAR FLOOD FLOWS WITH BASIN DEVELOPMENT TO YEAR 2000:
 - 1. ENCLOSED STORM SEWERS IN NEW PROPOSED PLATS.
- C. 25 YEAR FLOOD FLOWS WITH BASIN DEVELOPMENT TO YEAR 2000:
FOR IMPROVEMENTS IN THIS CATEGORY, THE CONSULTANT SHALL DESIGN THE STRUCTURE WITHOUT APPRECIABLY ALTERING THE FLOOD STAGE OF THE CHANNEL. THE EFFECT OF THE 100 YEAR FLOOD FLOW MUST ALSO BE SHOWN.
 - 1. COUNTY ROAD CROSS CULVERTS AND BRIDGES.
 - 2. OPEN CHANNEL DEVELOPMENT OR IMPROVEMENT (FLOW TO BE CONTAINED WITHIN THE CHANNEL).
 - 3. DRAIN ENCLOSURES WHERE THE DRAINAGE AREA IS GREATER THAN 300 ACRES BUT LESS THAN 2 SQUARE MILES.
- D. 10 YEAR FLOOD FLOWS WITH BASIN DEVELOPMENT TO YEAR 2000:
 - 1. OPEN CHANNELS, CULVERTS OR DRAIN ENCLOSURES WHERE THE DRAINAGE AREA IS NOT IN EXCESS OF 300 ACRES.

FLOW ESTIMATION: HYDROLOGY

MANY DIFFERENCT METHODS OF ARRIVING AT A GIVEN CFS FOR A SELECTED SPOT IN A DRAINAGE OUTLET HAVE BEEN DEVELOPED OVER THE YEARS. BECAUSE OF ITS GENERAL RECOGNITION AND WIDE USE WITHIN THE COUNTY, THE DRAIN COMMISSIONER WILL ACCEPT THE RATIONAL METHOD FOR FLOW COMPUTATION WHERE THE DRAINAGE AREA IS LESS THAN 100 ACRES. ENGINEERS ELECTING TO USE THIS METHOD FOR LARGER DRAINAGE AREA WILL BE REQUESTED TO ALSO USE AN ALTERNATE METHOD FOR COMPARISON.

THE FOLLOWING CRITERIA SHALL BE USED IN DETERMINING THE VARIABLES OF THE RATIONAL FORMULA $Q=CIA$.

- 1. **AREA** - THE AREA OF A BASIN OR SUB-BASIN SHALL BE DETERMINED BY USE OF 2' CONTOUR MAPS AVAILABLE AT THE COUNTY OFFICE WITH AN APPROPRIATE FIELD CHECK OR BY USE OF ESTABLISHED COUNTY DRAIN MAPS ON FILE AT G-4608 BEECHER RD.
- 2. **INTENSITY** - THE RAINFALL INTENSITY/T - DURATION FREQUENCY CURVES ATTACHED SHALL BE USED FOR STORM DRAIN DESIGN IN GENESEE COUNTY. COMPUTATION OF AN ACCURATE TIME OF CONCENTRARTION IS CRITICAL TO THE USE OF THESE CURVES. FOR URBAN STORM SEWERS AT TIME OF CONCENTRATION SHALL BE THE

SUMMATION OF THE INLET TIME PLUS THE TIME OF FLOW IN THE SEWER. FOR URBANIZED AREA A MINIMUM INITIAL TIME OF 20 MINUTES SHALL BE ACCEPTABLE FOR DESIGN AND FOR AVERAGE RURAL BASINS AN INITIAL TIME OF CONCENTRATION OF 30 MINUTES WILL PRESENT AN ADEQUATE TIME FOR STORM FLOWS TO PEAK. THE FLOW TIME IN AN ENCLOSED SYSTEM SHALL BE CALCULATED BY STANDARD DESIGN CHARTS. FOR CHANNEL VELOCITY THE STANDARD MANNING EQUATION $V=1.486 R^{2/3} S^{1/2}$ SHALL BE ACCEPTED. A CHART LISTING ACCEPTED N VALUES FOR STORM SEWER DESIGN IS ENCLOSED FOR USE IN DESIGN ANALYSIS.

3. RUNOFF COEFFICIENT - THE BASIN DEVELOPMENT SHALL BE PROJECTED TO THE YEAR 2000 AND THE RUNOFF COEFFICIENT MUST BE DETERMINED ON THE BASIS OF THIS PROJECTED DEVELOPMENT USING THE FOLLOWING:

A	FLAT UNDEVELOPED LANDS, FARMS, NONWOODED	0.25
B	WOODLANDS & SLOPED UNDEVELOPED LAND	0.30
C	PARKS, CEMETARIES, PLAYGROUNDS, DISTURBED GROUND	0.35
D	RESIDENTIAL	0.40
E	APARTMENTS, CONDOMINIUMS OF LT. MANUFACTURER	0.50
F	COMMERCIAL AND INDUSTRIAL	0.70
G	IMPERVIOUS AREAS (PARKING, ROOF, ETC.)	0.95
H	OPEN WATER	1.00

OUTLET CONDITIONS

ALL STORM SYSTEMS SHALL BE DESIGNED TO EXIT INTO AN OUTLET WITH SUFFICIENT CARRYING CAPACITY TO CARRY THE ADDITIONAL DESIGN FLOW.

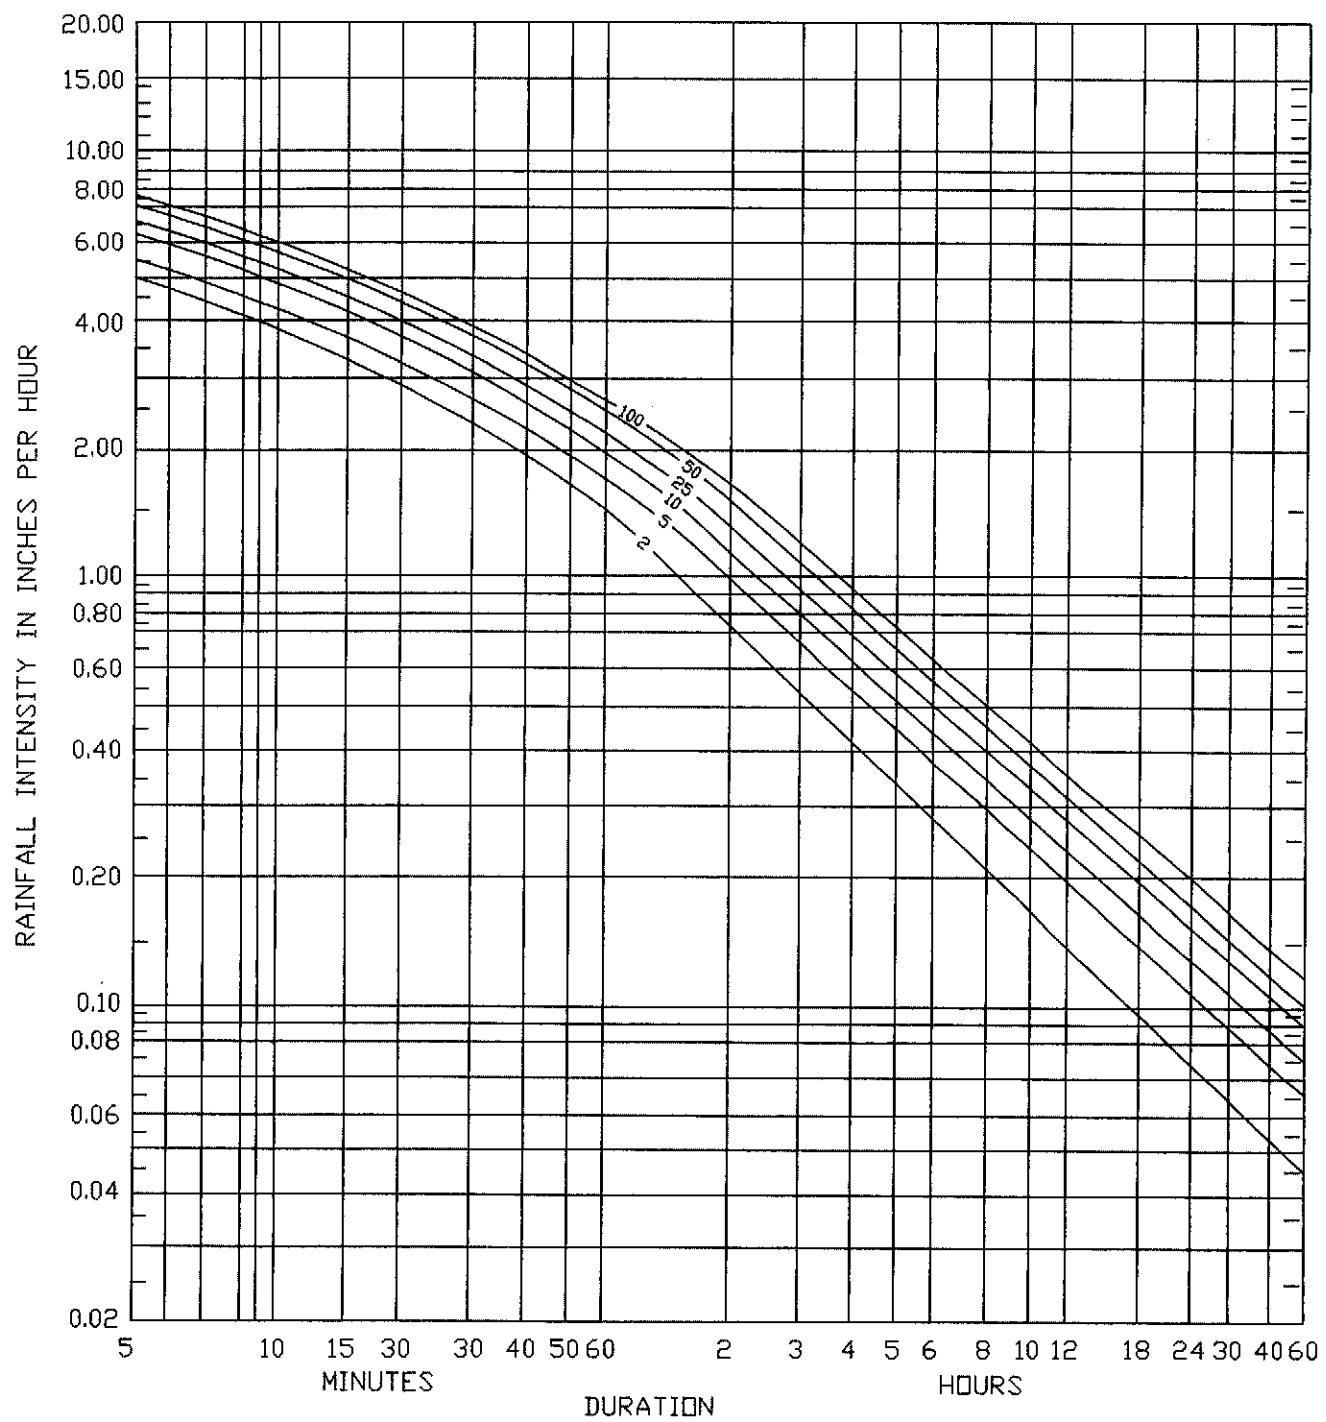

THE DESIGNER SHALL ANALYZE THIS CONDITION AND SUBMIT DATA SUBSTANTIATING HIS CONCLUSIONS. THIS INFORMATION SHALL BE SUBMITTED TO THE DRAIN COMMISSIONER ALONG WITH THE REQUIRED DESIGN FORMS.

IN THE EVENT THE DESIGNER DOES NOT HAVE SUFFICIENT CAPACITY IN THE OUTLET THE FOLLOWING CRITERIA SHALL APPLY:

1. THE SYSTEM SHALL BE DESIGNED TO OUTLET ONLY EXISTING RUNOFF. EXISTING RUNOFF SHALL CONSIST OF ALL WATER

PRESENTLY CONTRIBUTED TO THE DRAINAGE DISTRICT. THIS SHALL MEAN THE 2-YEAR STORM UNDER EXISTING CONDITIONS USING AGRICULTURAL LAND. (C= 0.25) ALL EXCESS SHALL BE RETAINED ON SITE FOR DURATION OF TIME NECESSARY TO PASS THE DESIGN STORM WITH DOWNSTREAM FLOODING. ~~THE OUTLET DISCHARGE SHALL NOT EXCEED 0.2 CFS/ACRE UNDER ANY EVENT.~~

2. THE TOWNSHIP SHALL PETITION THE DRAIN COMMISSIONER TO IMPROVE THE OUTLET TO THE REQUIRED SIZE TO PASS THE ADDITIONAL WATER AT THE DESIGN STORM. IN THE EVENT THIS PETITION IS NOT SUCCESSFUL CRITERIA #1 ABOVE SHALL APPLY.

RAINFALL INTENSITY - DURATION - FREQUENCY CURVES
FOR FLINT, MI

Table 2-2a.—Runoff curve numbers for urban areas¹

Cover type and hydrologic condition	Average percent impervious area ²	Curve numbers for hydrologic soil group—				
		A	B	C	D	
<i>Fully developed urban areas (vegetation established)</i>						
Open space (lawns, parks, golf courses, cemeteries, etc.) ³ :						
Poor condition (grass cover < 50%)	68	79	86	89		
Fair condition (grass cover 50% to 75%).....	49	69	79	84		
Good condition (grass cover > 75%)	39	61	74	80		
Impervious areas:						
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)	98	98	98	98		
Streets and roads:						
Paved; curbs and storm sewers (excluding right-of-way)	98	98	98	98		
Paved; open ditches (including right-of-way)	83	89	92	93		
Gravel (including right-of-way)	76	85	89	91		
Dirt (including right-of-way)	72	82	87	89		
Western desert urban areas:						
Natural desert landscaping (pervious areas only) ⁴ ...	63	77	85	88		
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders).	96	96	96	96		
Urban districts:						
Commercial and business.....	85	89	92	94	95	
Industrial.....	72	81	88	91	93	
Residential districts by average lot size:						
1/8 acre or less (town houses).....	65	77	85	90	92	
1/4 acre	88	61	75	83	87	
1/8 acre	30	57	72	81	86	
1/2 acre	25	54	70	80	85	
1 acre	20	51	68	79	84	
2 acres	12	46	65	77	82	
<i>Developing urban areas</i>						
Newly graded areas (pervious areas only, no vegetation) ⁵	77	86	91	94		
Idle lands (CN's are determined using cover types similar to those in table 2-2c).						

¹Average runoff condition, and $I_s = 0.2S$.

²The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition; CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.

³CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.

⁴Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.

⁵Composite CN's to use for the design of temporary measures during grading and construction should be computed using figure 2-3 or 2-4, based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

Table 2-2b.—Runoff curve numbers for cultivated agricultural lands¹

Cover type	Treatment ²	Hydrologic condition ³	Curve numbers for hydrologic soil group—			
			A	B	C	D
Fallow	Bare soil	—	77	86	91	94
	Crop residue cover (CR)	Poor	76	85	90	93
		Good	74	83	88	90
Row crops	Straight row (SR)	Poor	72	81	88	91
		Good	67	78	85	89
	SR + CR	Poor	71	80	87	90
		Good	64	75	82	85
	Contoured (C)	Poor	70	79	84	88
		Good	65	75	82	86
	C + CR	Poor	69	78	83	87
		Good	64	74	81	85
	Contoured & terraced (C&T)	Poor	66	74	80	82
		Good	62	71	78	81
	C&T + CR	Poor	65	73	79	81
		Good	61	70	77	80
Small grain	SR	Poor	65	76	84	88
		Good	63	75	83	87
	SR + CR	Poor	64	75	83	86
		Good	60	72	80	84
	C	Poor	63	74	82	85
		Good	61	73	81	84
	C + CR	Poor	62	73	81	84
		Good	60	72	80	83
	C&T	Poor	61	72	79	82
		Good	59	70	78	81
	C&T + CR	Poor	60	71	78	81
		Good	58	69	77	80
Close-seeded or broadcast legumes or rotation meadow	SR	Poor	66	77	85	89
		Good	58	72	81	85
	C	Poor	64	75	83	85
		Good	55	69	78	83
	C&T	Poor	68	73	80	83
		Good	51	67	76	80

¹Average runoff condition, and $I_u = 0.2S$.

²Crop residue cover applies only if residue is on at least 5% of the surface throughout the year.

³Hydrologic condition is based on combination of factors that affect infiltration and runoff, including (a) density and canopy of vegetative areas, (b) amount of year-round cover, (c) amount of grass or close-seeded legumes in rotations, (d) percent of residue cover on the land surface (good $\geq 20\%$), and (e) degree of surface roughness.

Poor: Factors impair infiltration and tend to increase runoff.

Good: Factors encourage average and better than average infiltration and tend to decrease runoff.

Table 2-2c.—Runoff curve numbers for other agricultural lands¹

Cover type	Cover description	Hydrologic condition	Curve numbers for hydrologic soil group—			
			A	B	C	D
Pasture, grassland, or range—continuous forage for grazing. ²		Poor	68	79	86	89
		Fair	49	69	79	84
		Good	39	61	74	80
Meadow—continuous grass, protected from grazing and generally mowed for hay.		—	80	58	71	78
Brush—brush-weed-grass mixture with brush the major element. ³		Poor	48	67	77	83
		Fair	35	56	70	77
		Good	30	48	65	73
Woods—grass combination (orchard or tree farm). ⁴		Poor	57	73	82	86
		Fair	43	65	76	82
		Good	32	58	72	79
Woods. ⁵		Poor	45	66	77	83
		Fair	36	60	73	79
		Good	30	55	70	77
Farmsteads—buildings, lanes, driveways, and surrounding lots.		—	59	74	82	86

¹Average runoff condition, and $I_n = 0.2S$.

²Poor: <50% ground cover or heavily grazed with no mulch.

Fair: 50 to 75% ground cover and not heavily grazed.

Good: >75% ground cover and lightly or only occasionally grazed.

³Poor: <50% ground cover.

Fair: 50 to 75% ground cover.

Good: >75% ground cover.

⁴Actual curve number is less than 30; use CN = 30 for runoff computations.

⁵CN's shown were computed for areas with 50% woods and 50% grass (pasture) cover. Other combinations of conditions may be computed from the CN's for woods and pasture.

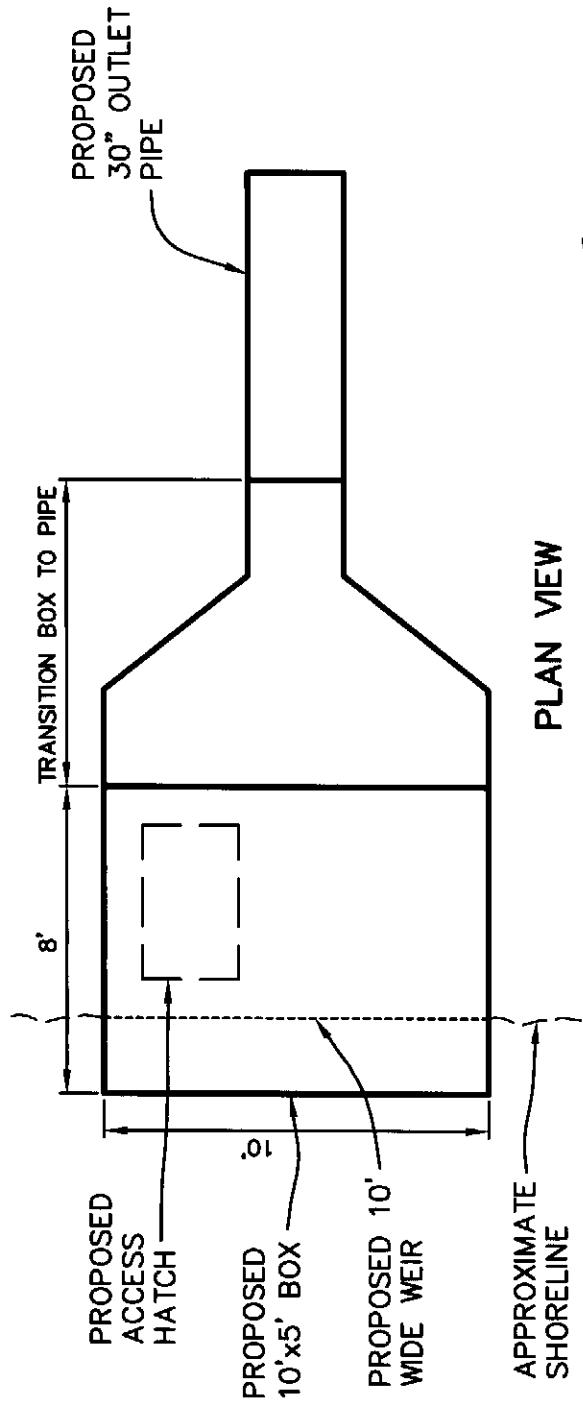

⁶Poor: Forest litter, small trees, and brush are destroyed by heavy grazing or regular burning.

Fair: Woods are grazed but not burned, and some forest litter covers the soil.

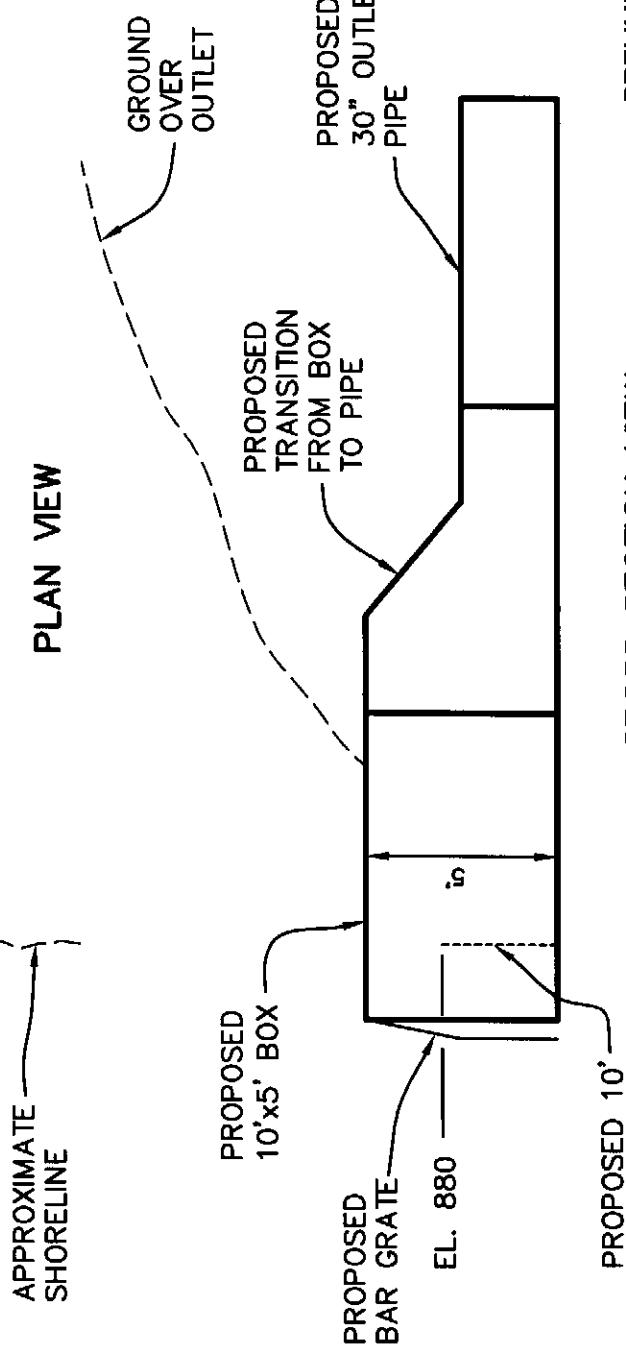

Good: Woods are protected from grazing, and litter and brush adequately cover the soil.

FLOOD HYDROGRAPH REPORT

Hydrograph Number: 2
Name: FLD-100 YR-EX-ROUTED
Type: Reservoir: Storage Indication

[HYDROGRAPH INFORMATION]

Peak Flow (Qp) = 28.64 (cfs) ← ROUTED OUTFLOW
 Time to Peak (Tp) = 1485.00 (min)
 Time of Base (Tb) = 21600.00 (min)
 Volume = 148.97 (ac-ft)
 Time Step = 15.00 (min)
 Peak Elevation = 880.92 (ft) ←
 Detention Time = NA

[RESERVOIR STRUCTURE INFORMATION]

WATER STRUCTURE INFORMATION

Number	=	1
Name	=	PINE LAKE RESERVOIR
Storage Type	=	User-Defined Area
Maximum Storage	=	12475750.00 (cu ft)
Maximum Discharge	=	90.42 (cfs)

[INFLOW HYDROGRAPH INFORMATION]

Number	=	1
Name	=	FLD-100 YR-SB1-EX OVERALL AREA
Peak Flow (Qp)	=	569.81 (cfs)
Time to Peak (Tp)	=	795.00 (min)
Time of Base (Tb)	=	1820.44 (min)
Volume	=	152.98 (ac-ft)
Flow Multiplier	=	1.00

[EQUATION]

$$0.5(I_1+I_2)dt + S_1 - 0.5(O_2)dt$$

Where:

```

I1 = Previous Inflow
I2 = Current Inflow
dt = Time increment
S1 = Previous Storage
S2 = Current Storage
O1 = Previous Outflow
O2 = Current Outflow

```

$$A = 0.5 (I1+I2) dt$$

$$B = S_1 - 0.5 \langle O_1 \rangle dt$$

$$C = S_2 + 0.5 \quad (92) \quad dt$$

Worksheet for 30" PIPE - ALT 2

Project Description

Flow Element: Circular Pipe
Friction Method: Manning Formula
Solve For: Full Flow Capacity

Input Data

Roughness Coefficient: 0.013
Channel Slope: 0.75000 %
Diameter: 30.00 in

Results

Discharge: 35.52 ft³/s
Normal Depth: 30.00 in
Flow Area: 4.91 ft²
Wetted Perimeter: 7.85 ft
Top Width: 0.00 ft
Critical Depth: 2.02 ft
Percent Full: 100.0 %
Critical Slope: 0.00768 ft/ft
Velocity: 7.24 ft/s
Velocity Head: 0.81 ft
Specific Energy: 3.31 ft
Froude Number: 0.00
Maximum Discharge: 38.21 ft³/s
Discharge Full: 35.52 ft³/s
Slope Full: 0.00750 ft/ft
Flow Type: SubCritical

GVF Input Data

Downstream Depth: 0.00 in
Length: 0.00 ft
Number Of Steps: 0

GVF Output Data

Upstream Depth: 0.00 in
Profile Description:
Profile Headloss: 0.00 ft
Average End Depth Over Rise: 0.00 %
Normal Depth Over Rise: 1.00 %
Downstream Velocity: Infinity ft/s

Worksheet for 30" PIPE - ALT 2

Upstream Velocity:	Infinity	ft/s
Normal Depth:	30.00	in
Critical Depth:	2.02	ft
Channel Slope:	0.75000	%
Critical Slope:	0.00768	ft/ft
